

# Descriptors

CSE 576

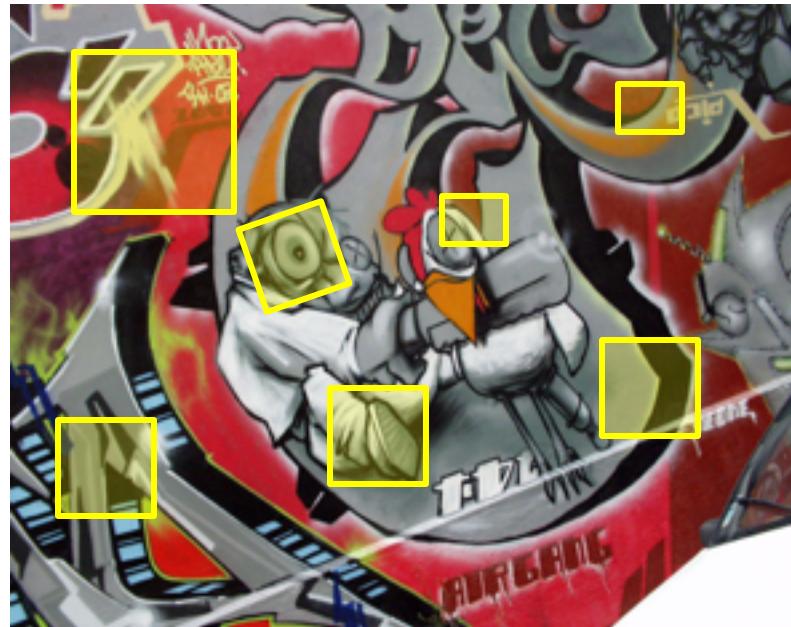

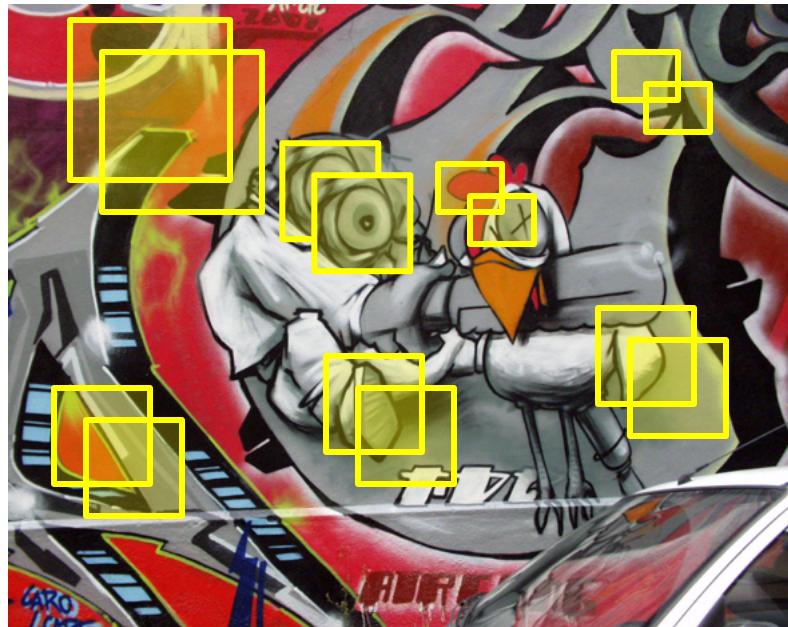

Ali Farhadi

Many slides from Larry Zitnick, Steve Seitz

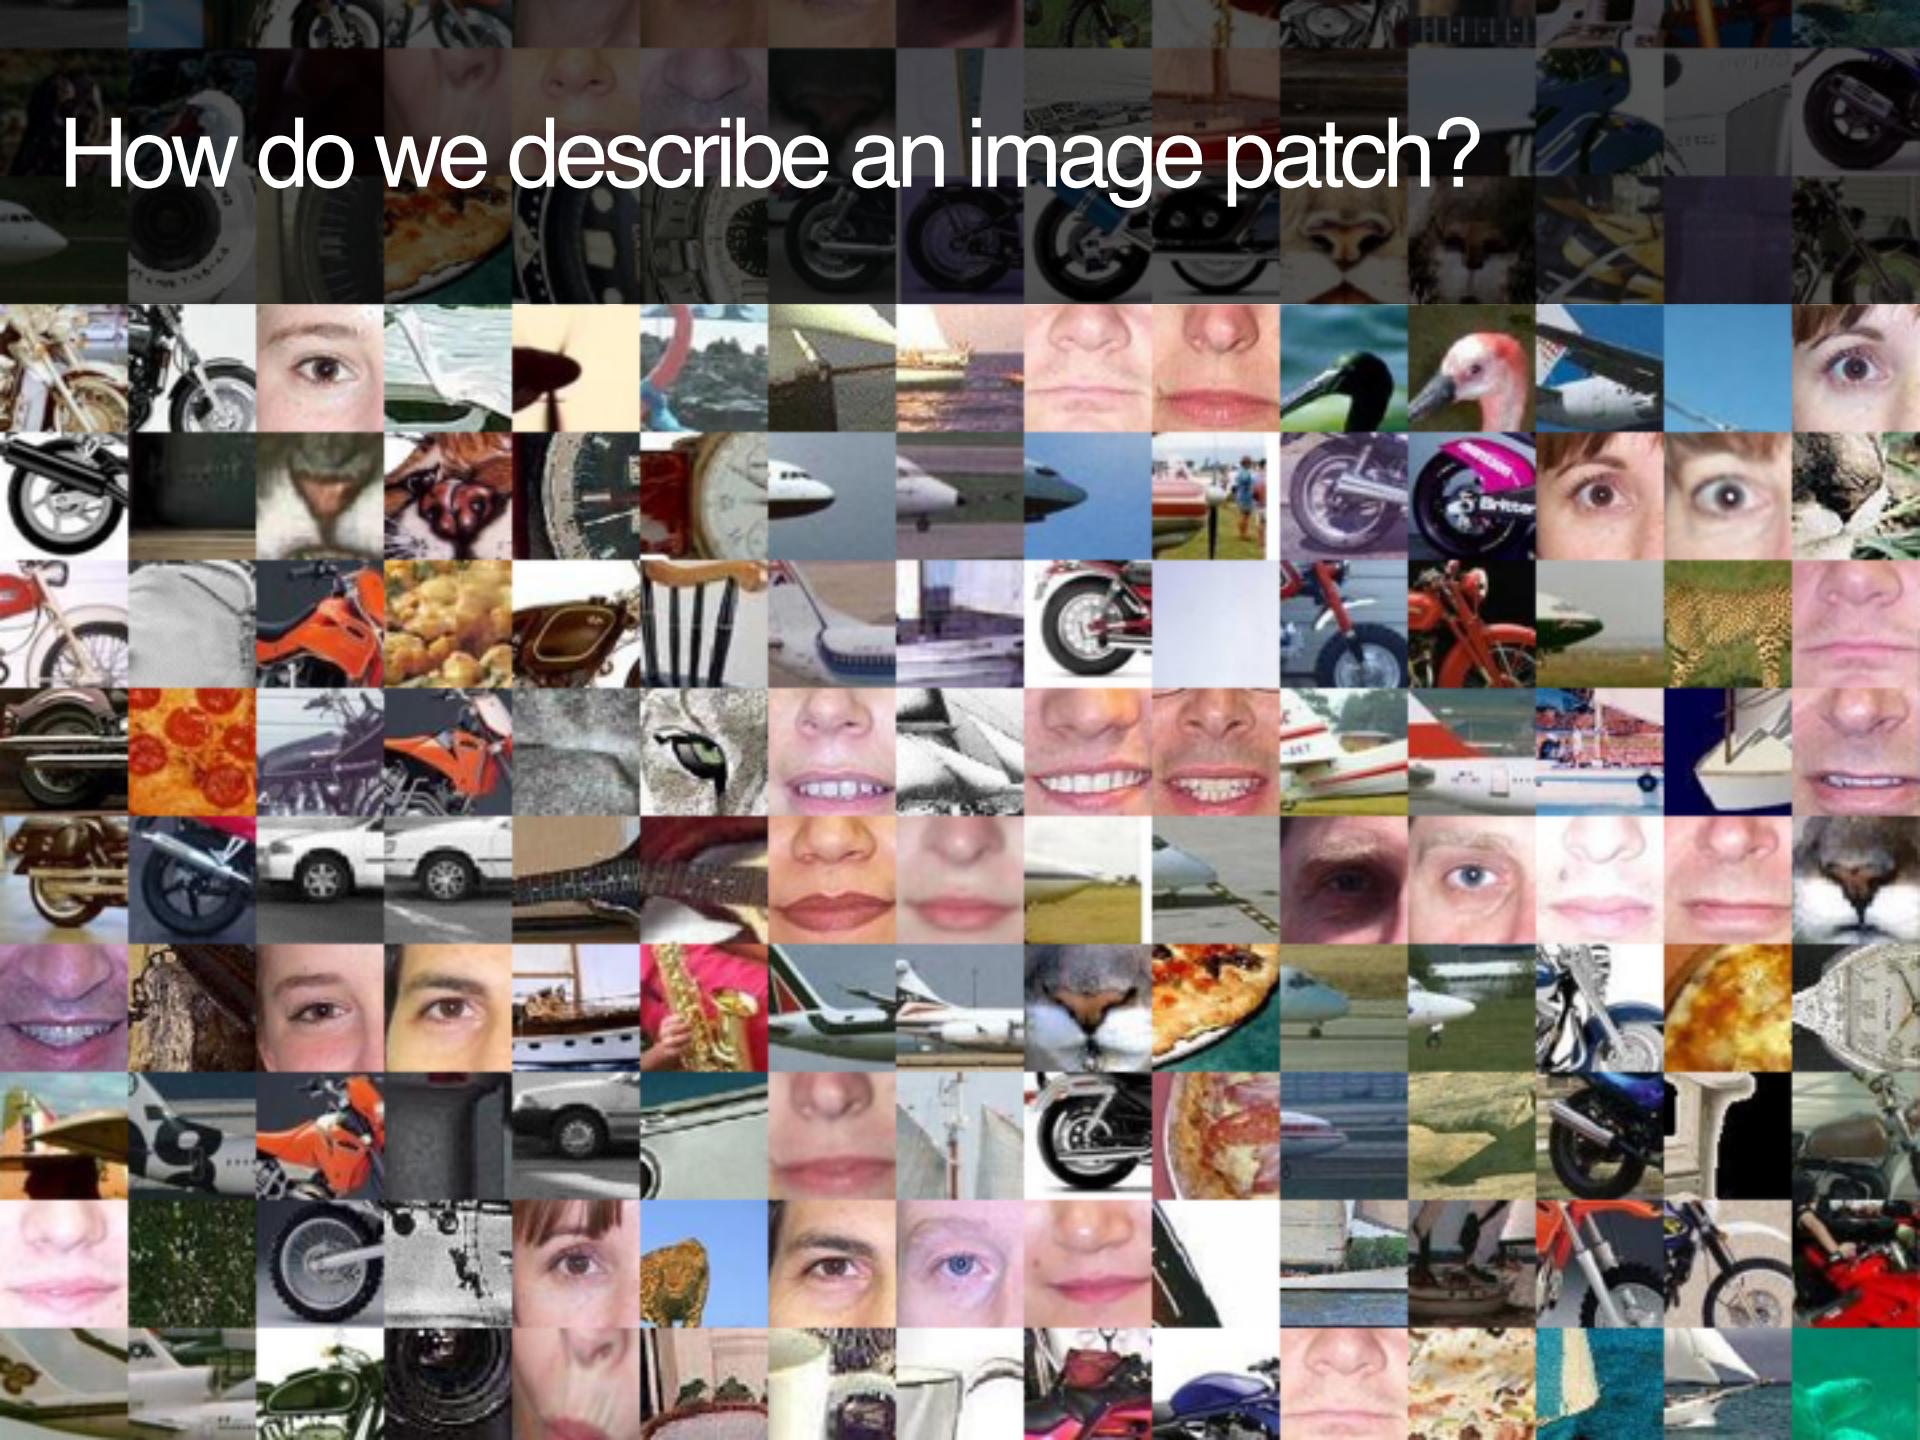

# How can we find corresponding points?

# How can we find correspondences?

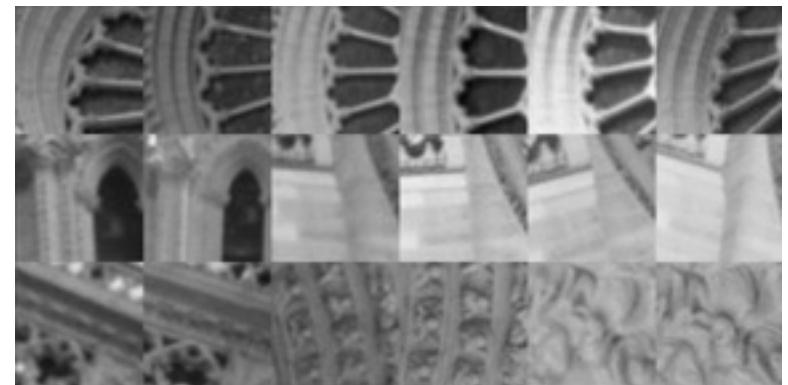

# How do we describe an image patch?

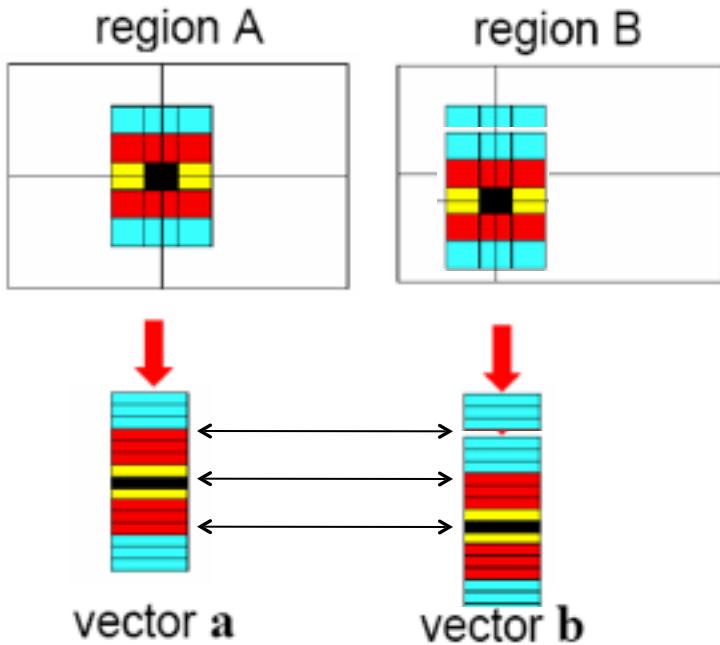

# How do we describe an image patch?

Patches with similar content should have similar descriptors.

# Raw patches as local descriptors

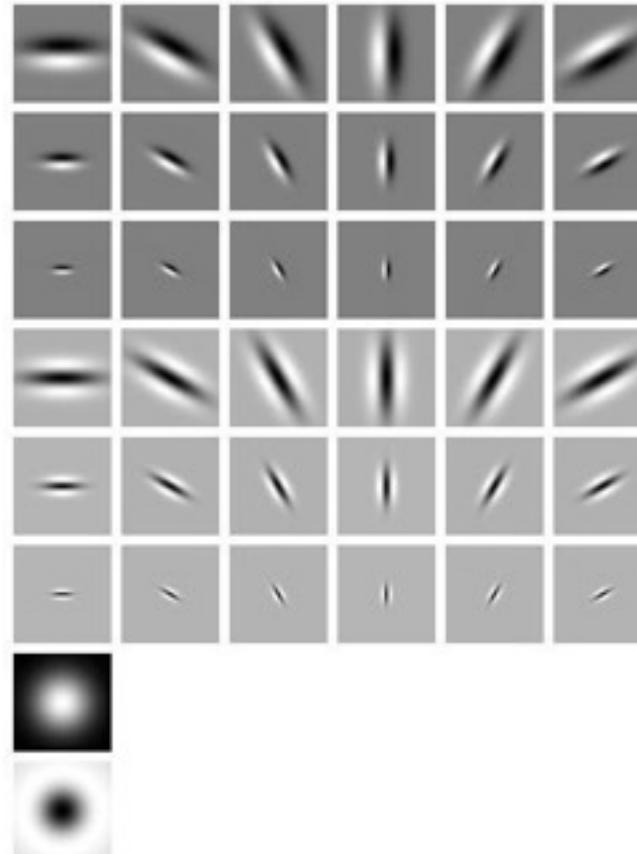

The simplest way to describe the neighborhood around an interest point is to write down the list of intensities to form a feature vector.

But this is very sensitive to even small shifts, rotations.

# What do human use?

Gabor filters...

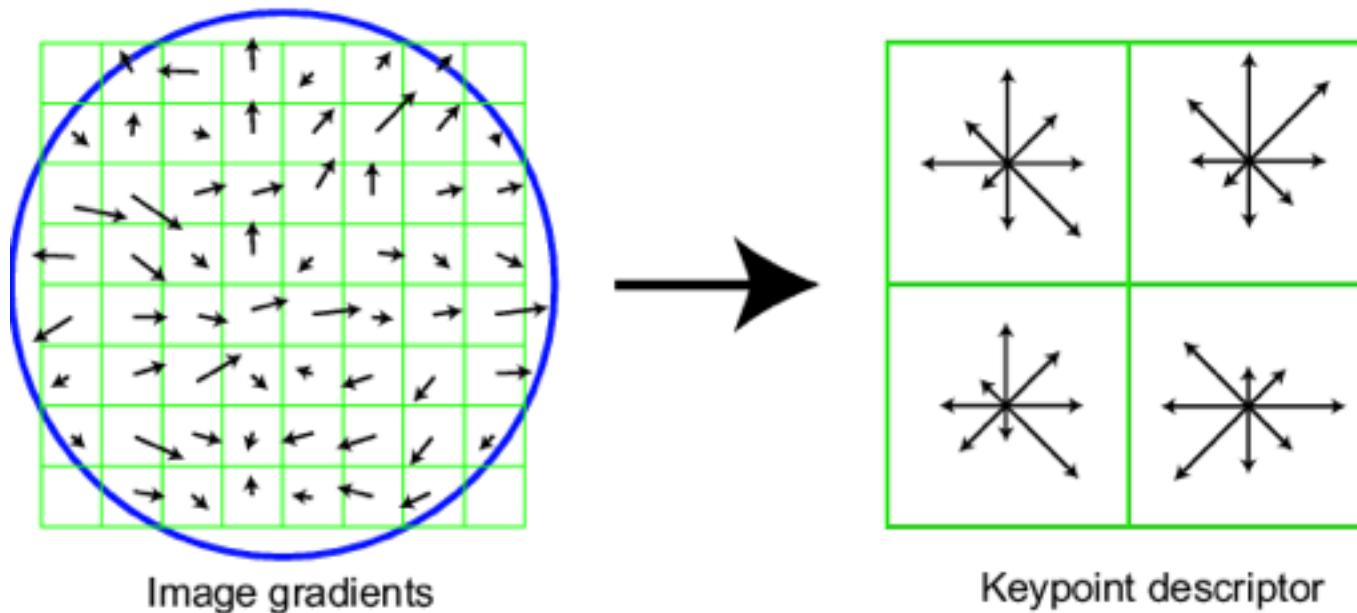

... and many other things.

# SIFT descriptor

---

## Full version

- Divide the 16x16 window into a 4x4 grid of cells (2x2 case shown below)
- Compute an orientation histogram for each cell
- 16 cells \* 8 orientations = 128 dimensional descriptor

Adapted from slide by David Lowe

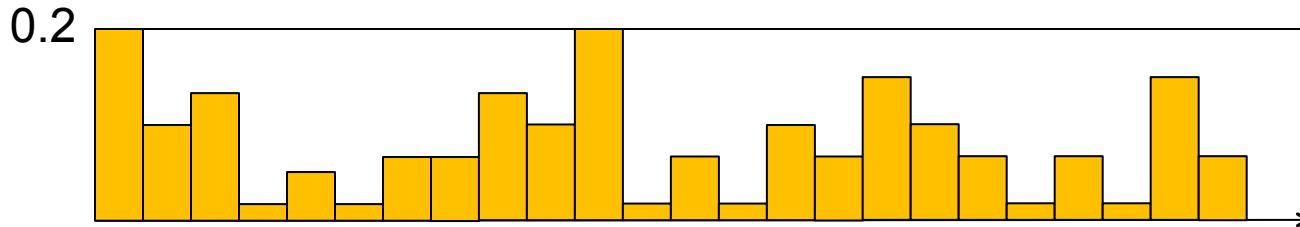

# SIFT descriptor

---

## Full version

- Divide the 16x16 window into a 4x4 grid of cells (2x2 case shown below)
- Compute an orientation histogram for each cell
- 16 cells \* 8 orientations = 128 dimensional descriptor
- Threshold normalize the descriptor:

$$\sum_i d_i^2 = 1 \quad \text{such that: } d_i < 0.2$$

Adapted from slide by David Lowe

# Properties of SIFT

---

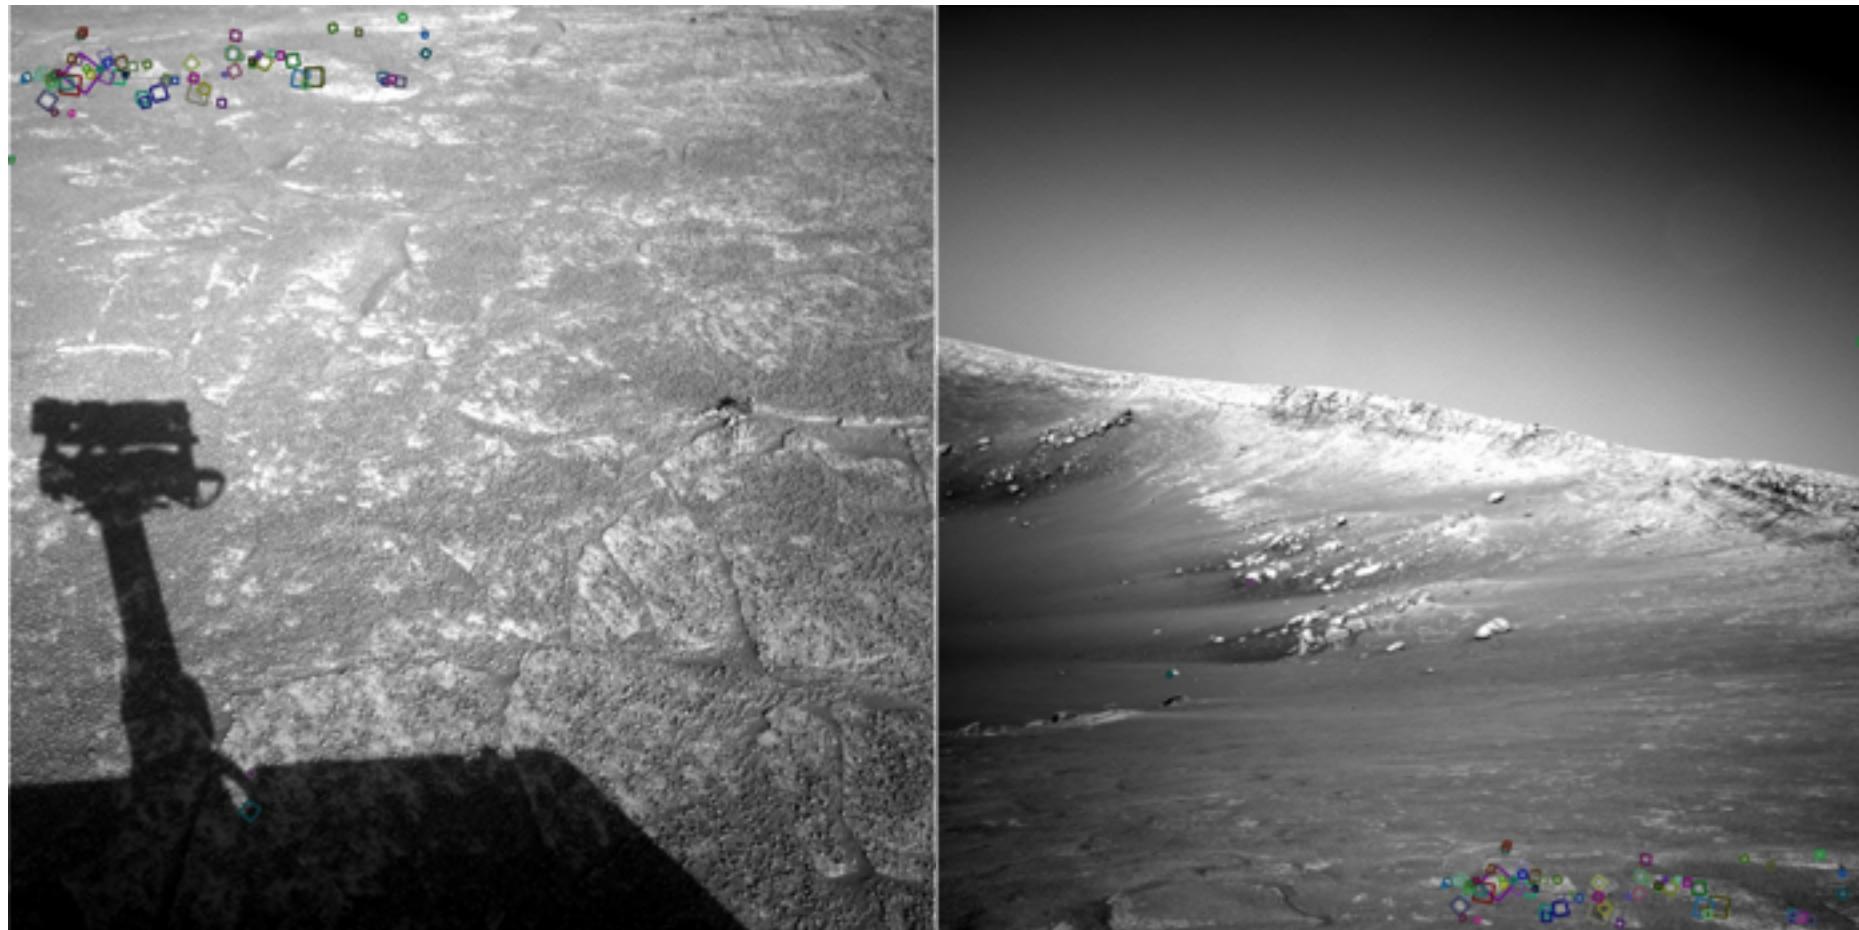

Extraordinarily robust matching technique

- Can handle changes in viewpoint
  - Up to about 30 degree out of plane rotation
- Can handle significant changes in illumination
  - Sometimes even day vs. night (below)
- Fast and efficient—can run in real time
- Lots of code available
  - [http://people.csail.mit.edu/albert/ladypack/wiki/index.php/Known\\_implementations\\_of\\_SIFT](http://people.csail.mit.edu/albert/ladypack/wiki/index.php/Known_implementations_of_SIFT)

# Example

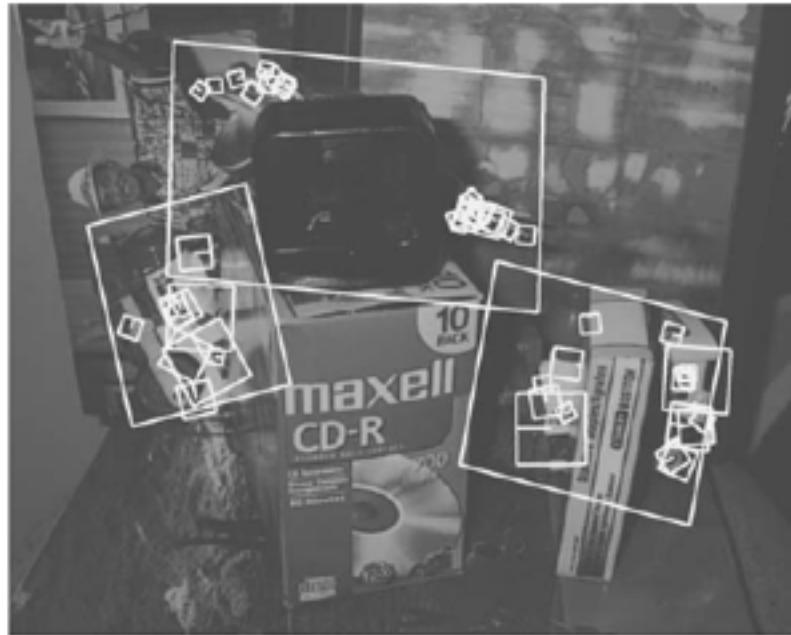

---

NASA Mars Rover images  
with SIFT feature matches  
Figure by Noah Snavely

# Example: Object Recognition

---

SIFT is extremely powerful for object instance recognition, especially for well-textured objects

# Example: Google Goggle

Wine

Logo

The smartphone screen shows the Google Goggle search results for the wine. At the top, it says "Google goggles labs". Below that, there is a "Wine" result for "Bodegas Terrazas De Los Andes Malbec Reserva 2004", showing a thumbnail image of the wine bottle. Underneath, there is a "Web Results" section for "Terrazas de los Andes", listing years from 2009 down to 1984. At the bottom, there is a link to the website "http://www.terrazasdelosandes.com/".

Popular wines by Bodegas Terrazas de los Andes.

# panorama?

---

- We need to match (align) images

# Matching with Features

---

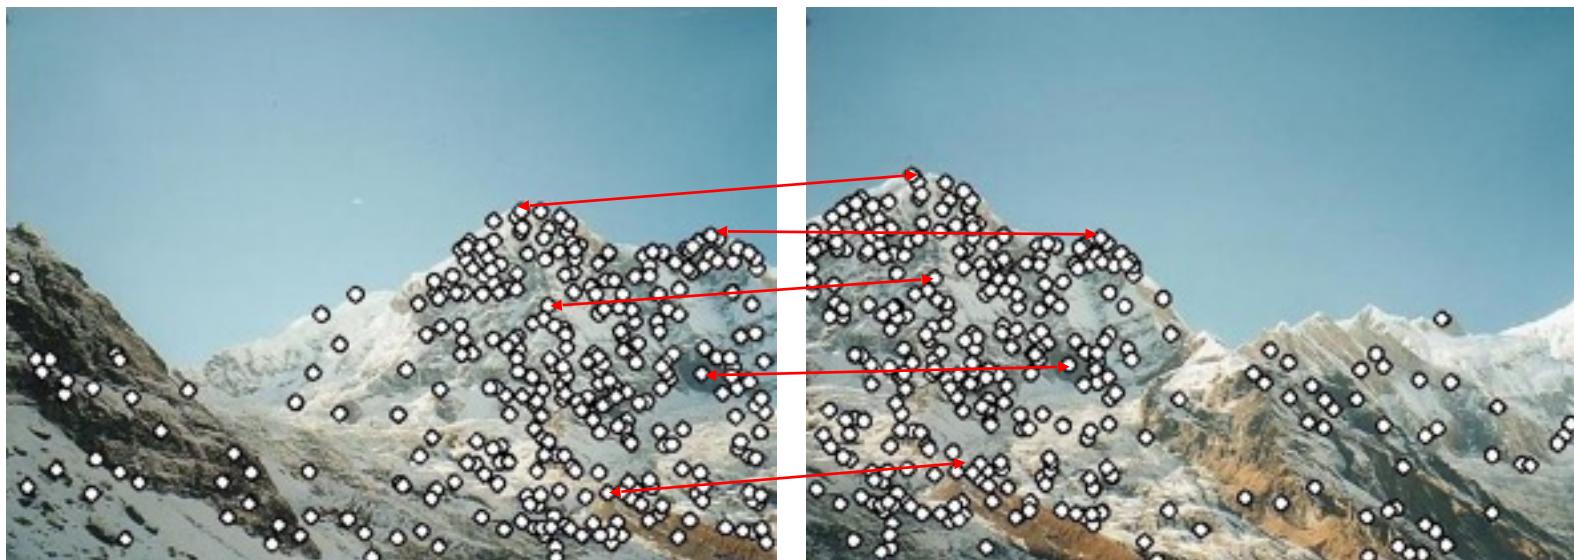

- Detect feature points in both images

# Matching with Features

---

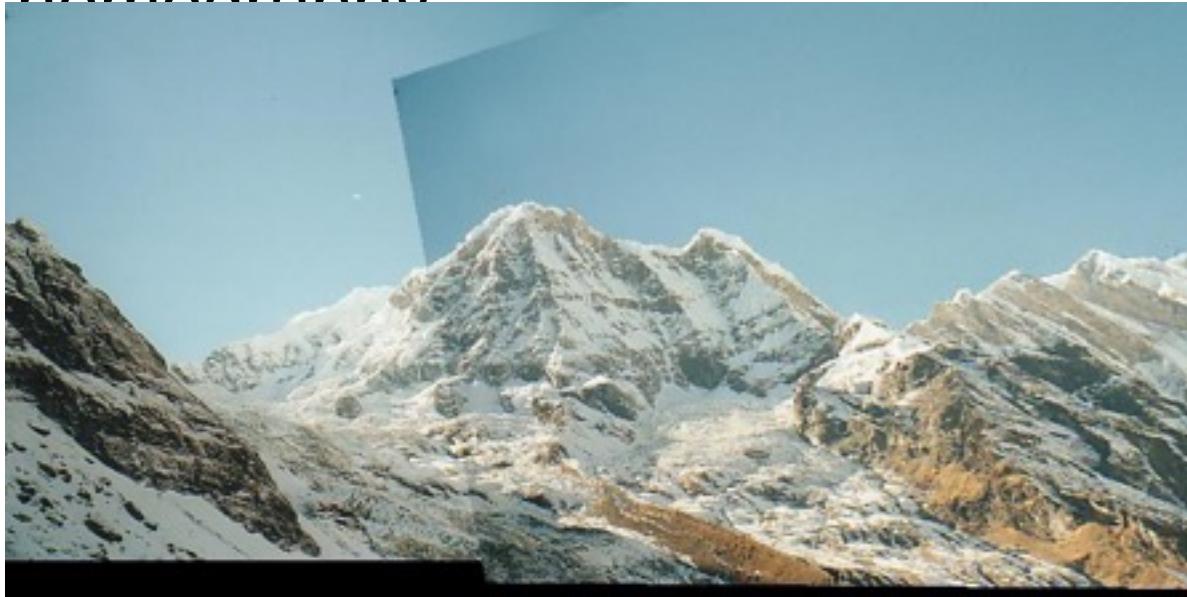

- Detect feature points in both images
- Find corresponding pairs

# Matching with Features

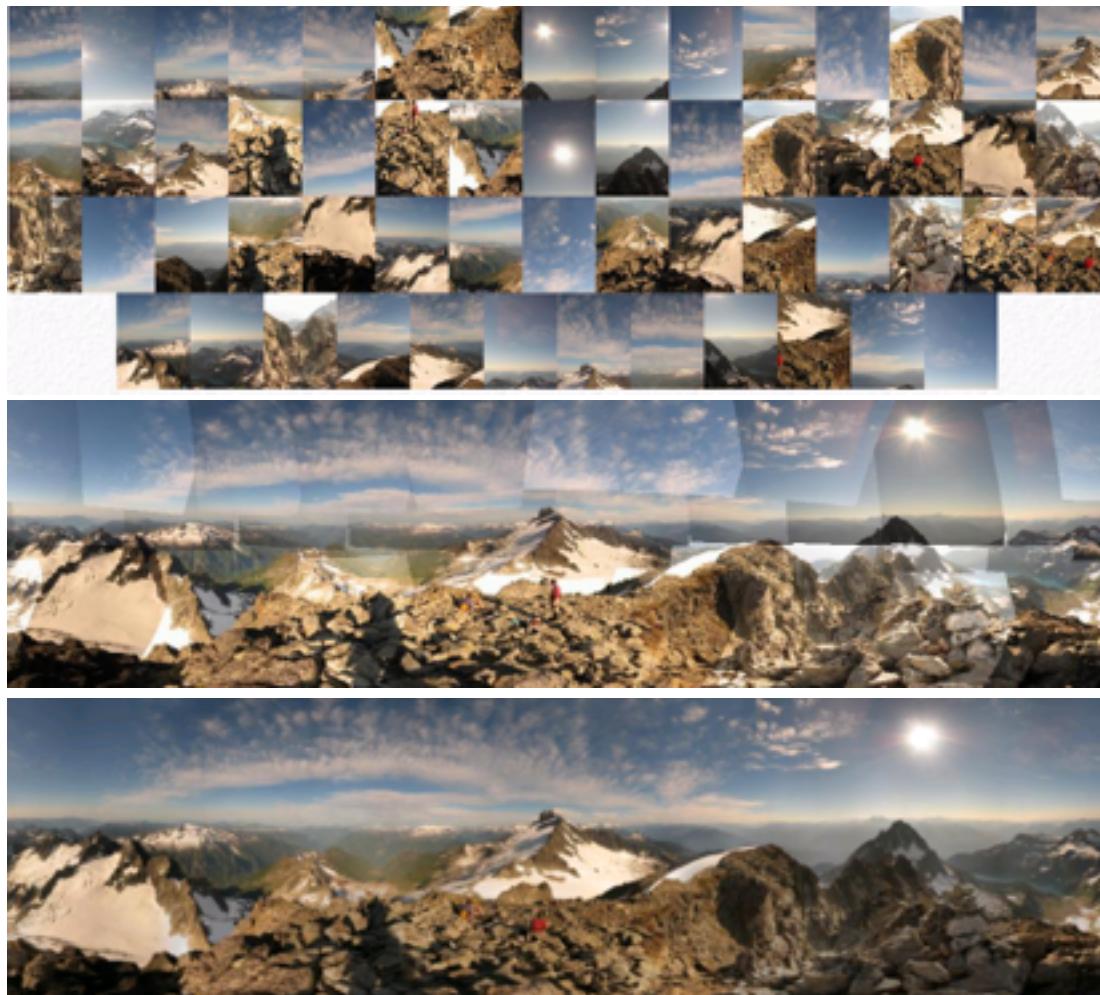

---

- Detect feature points in both images
- Find corresponding pairs
- Use these matching pairs to align images -  
the required mapping is called a  
homography

# Automatic mosaicing

Sivic and Zisserman, 2003

Rothganger et al. 2003

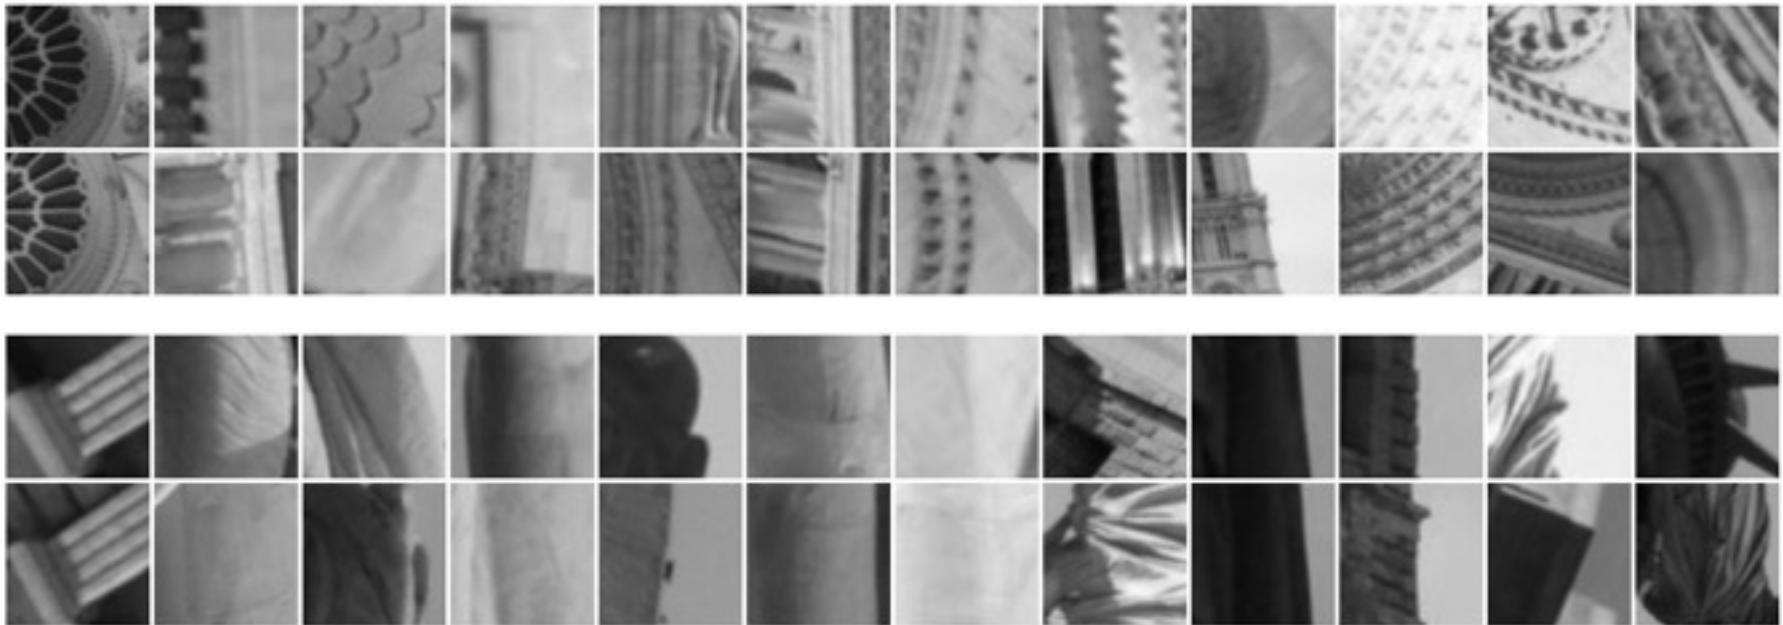

Lowe 2002

# When does SIFT fail?

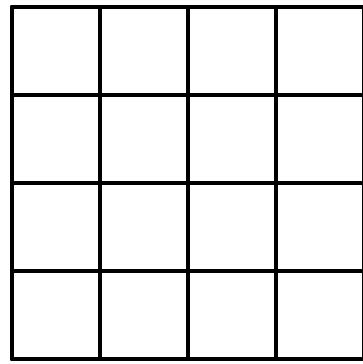

---

Patches SIFT thought were the same but aren't:

# Other methods: Daisy

---

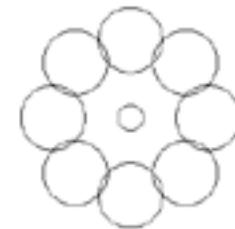

SIFT

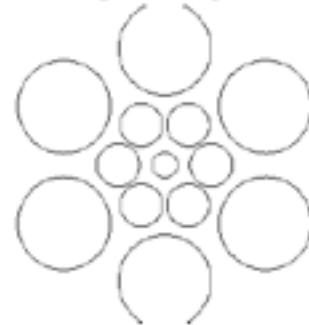

Circular gradient binning

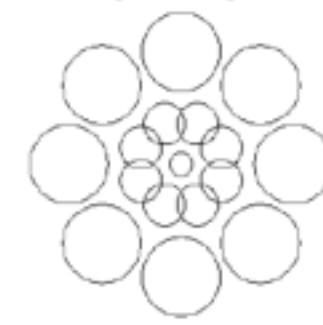

1 Ring 6 Segments

1 Ring 8 Segments

2 Rings 6 Segments

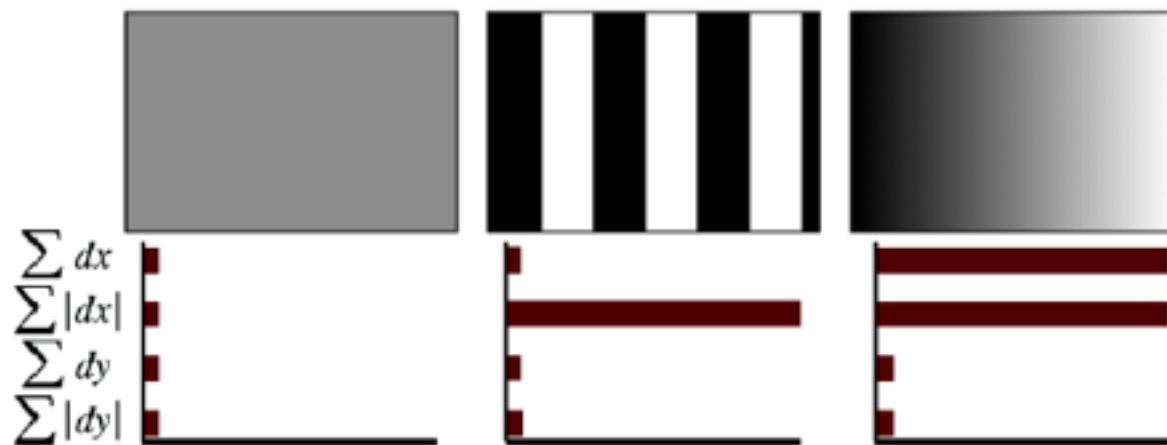

2 Rings 8 Segments

Daisy

# Other methods: SURF

---

For computational efficiency only compute gradient histogram with 4 bins:

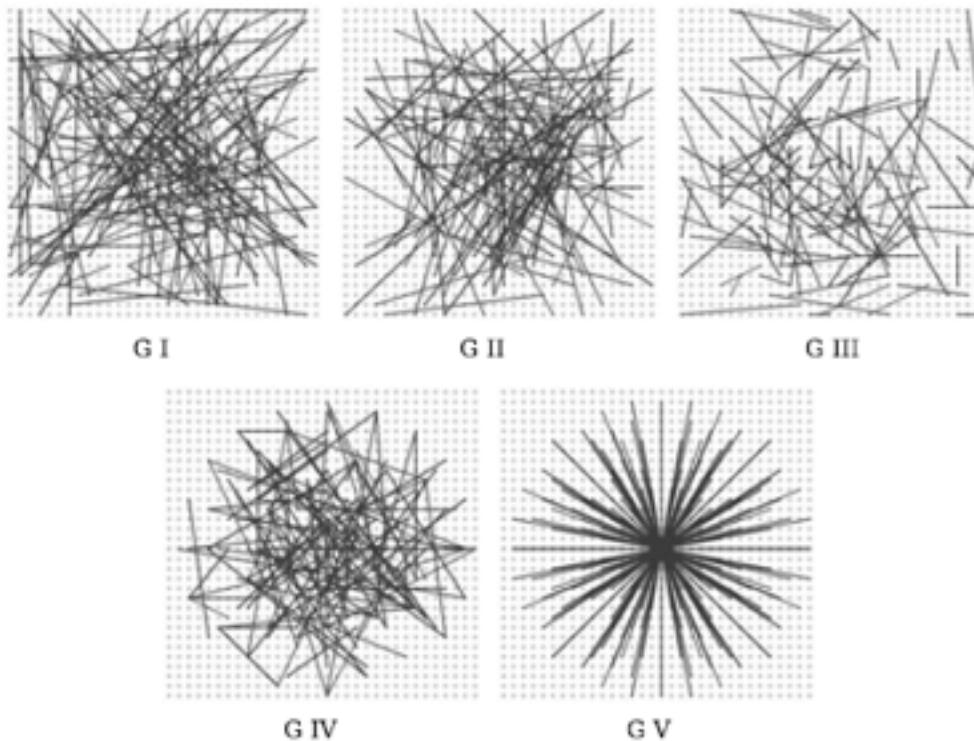

**Fig. 3.** The descriptor entries of a sub-region represent the nature of the underlying intensity pattern. Left: In case of a homogeneous region, all values are relatively low. Middle: In presence of frequencies in  $x$  direction, the value of  $\sum |d_x|$  is high, but all others remain low. If the intensity is gradually increasing in  $x$  direction, both values  $\sum d_x$  and  $\sum |d_x|$  are high.

# Other methods: BRIEF

---

Randomly sample pair of pixels a and b.  
1 if  $a > b$ , else 0. Store binary vector.

**Fig. 2.** Different approaches to choosing the test locations. All except the rightmost one are selected by random sampling. Showing 128 tests in every image.

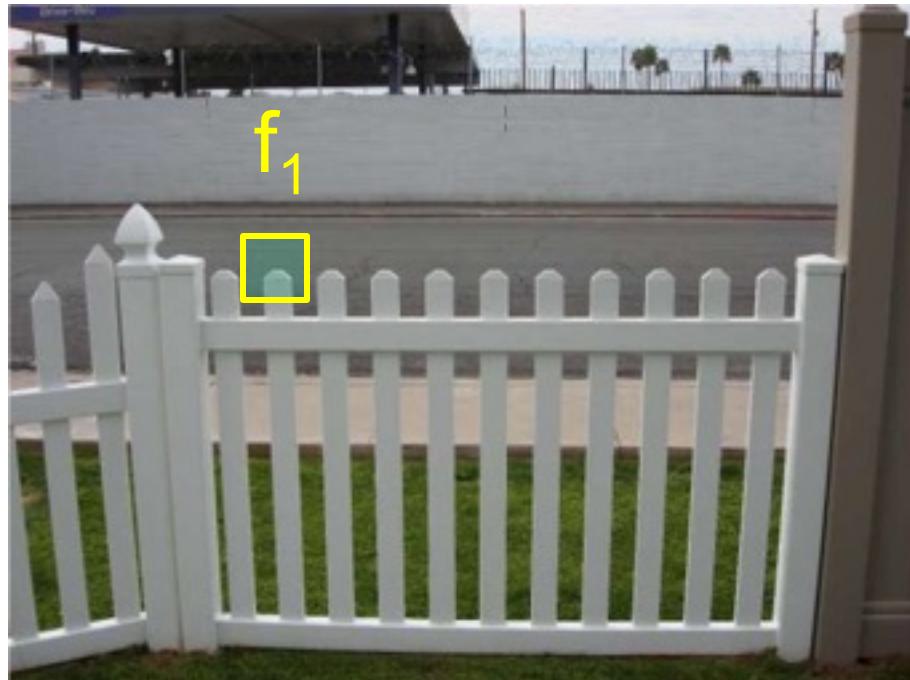

BRIEF: binary robust independent elementary features, Calonder,  
V Lepetit, C Strecha, ECCV 2010

# Feature distance

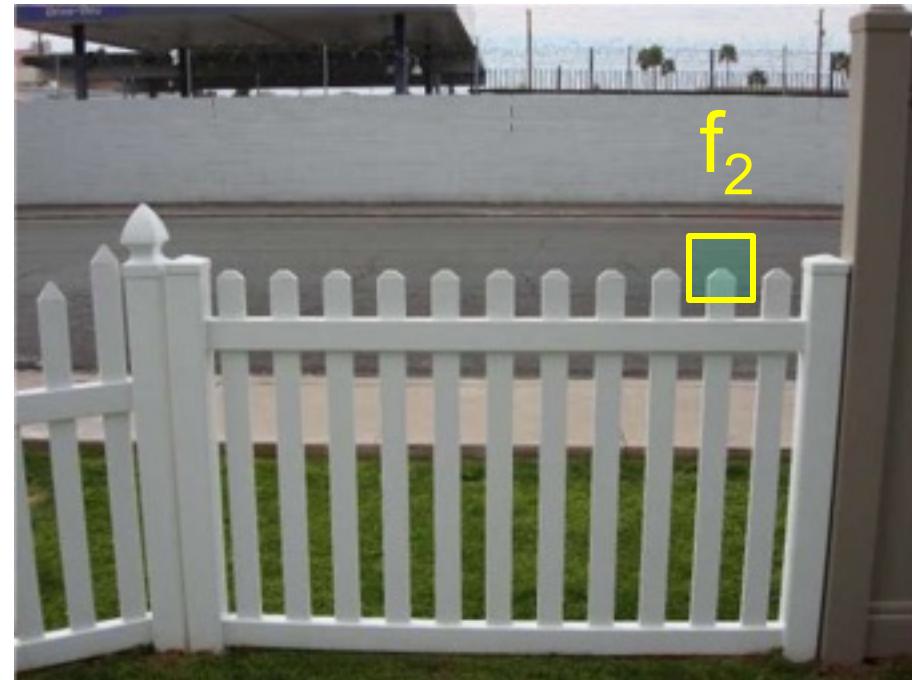

---

How to define the difference between two features  $f_1$ ,  $f_2$ ?

- Simple approach is  $\text{SSD}(f_1, f_2)$ 
  - sum of square differences between entries of the two descriptors
  - can give good scores to very ambiguous (bad) matches

$I_1$

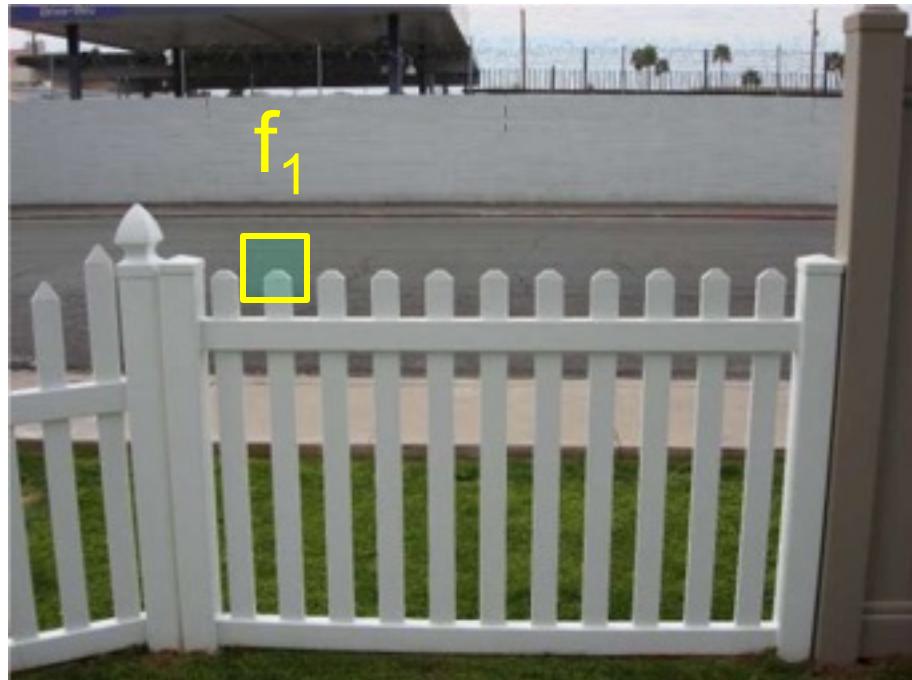

$I_2$

# Feature distance

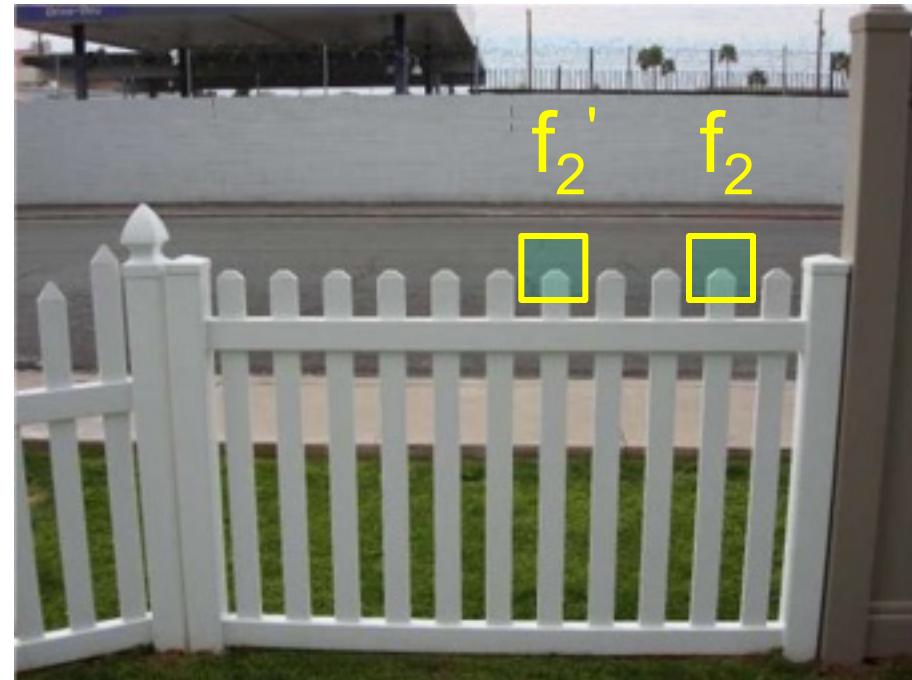

---

How to define the difference between two features  $f_1$ ,  $f_2$ ?

- Better approach: ratio distance =  $\text{SSD}(f_1, f_2) / \text{SSD}(f_1, f_2')$ 
  - $f_2$  is best SSD match to  $f_1$  in  $I_2$
  - $f_2'$  is 2<sup>nd</sup> best SSD match to  $f_1$  in  $I_2$
  - gives large values (~1) for ambiguous matches

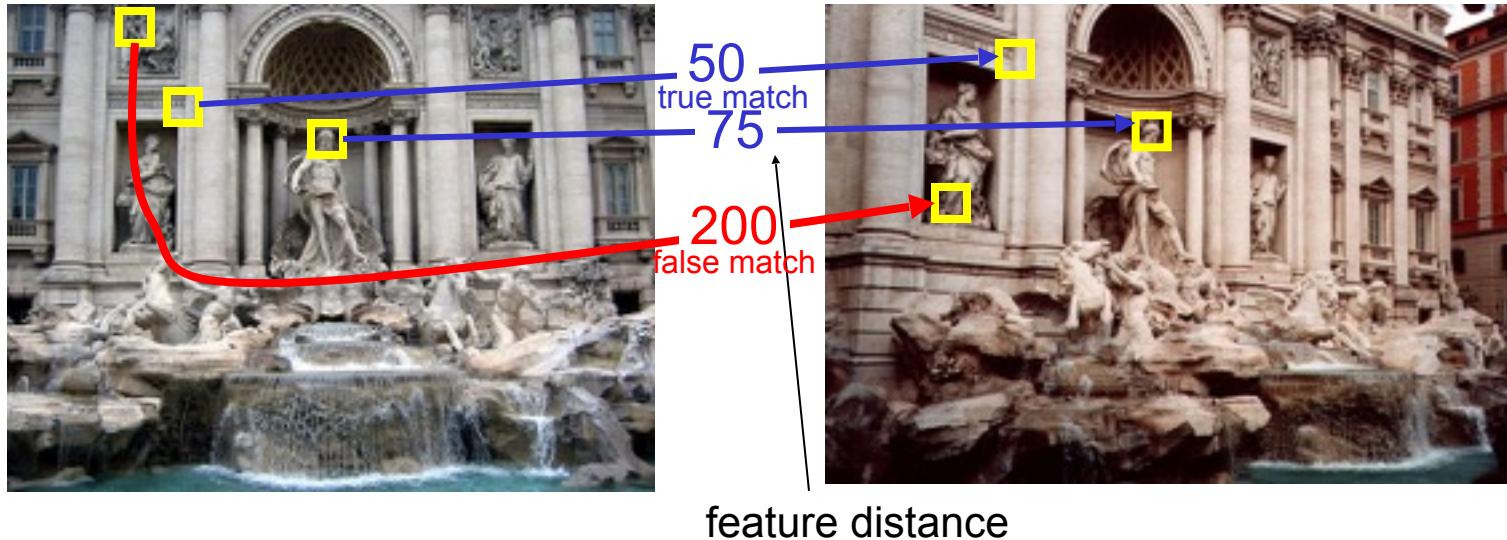

$I_1$

$I_2$

# Eliminating bad matches

---

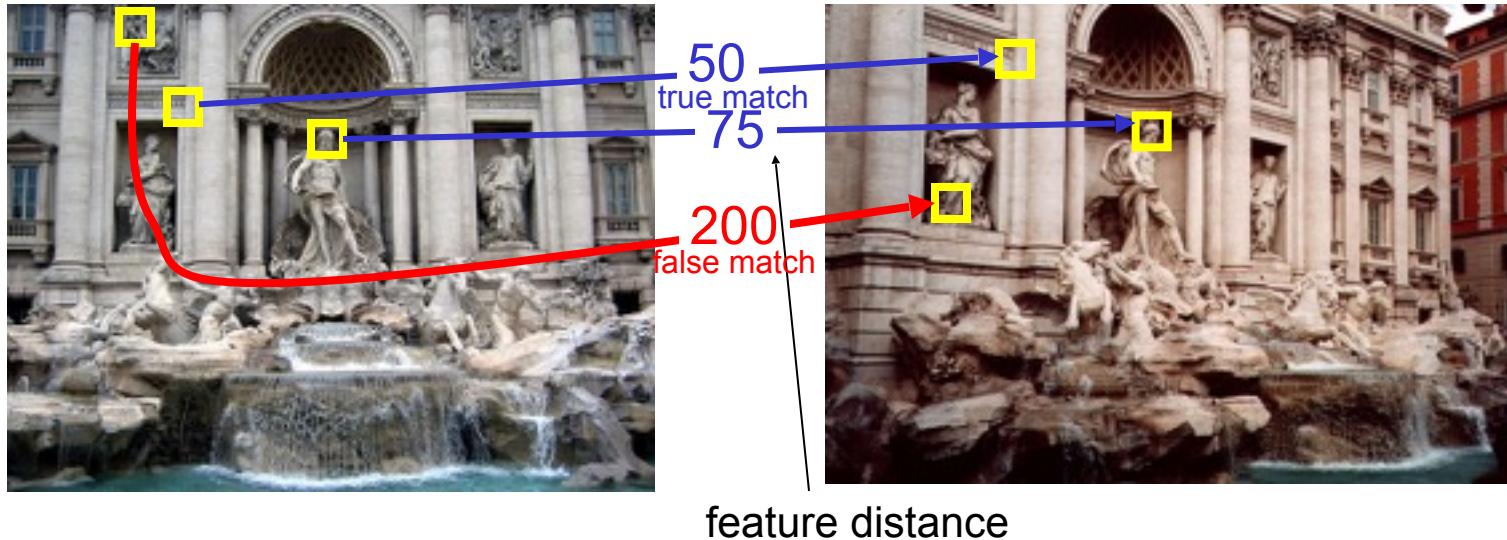

Throw out features with distance > threshold

- How to choose the threshold?

# True/false positives

---

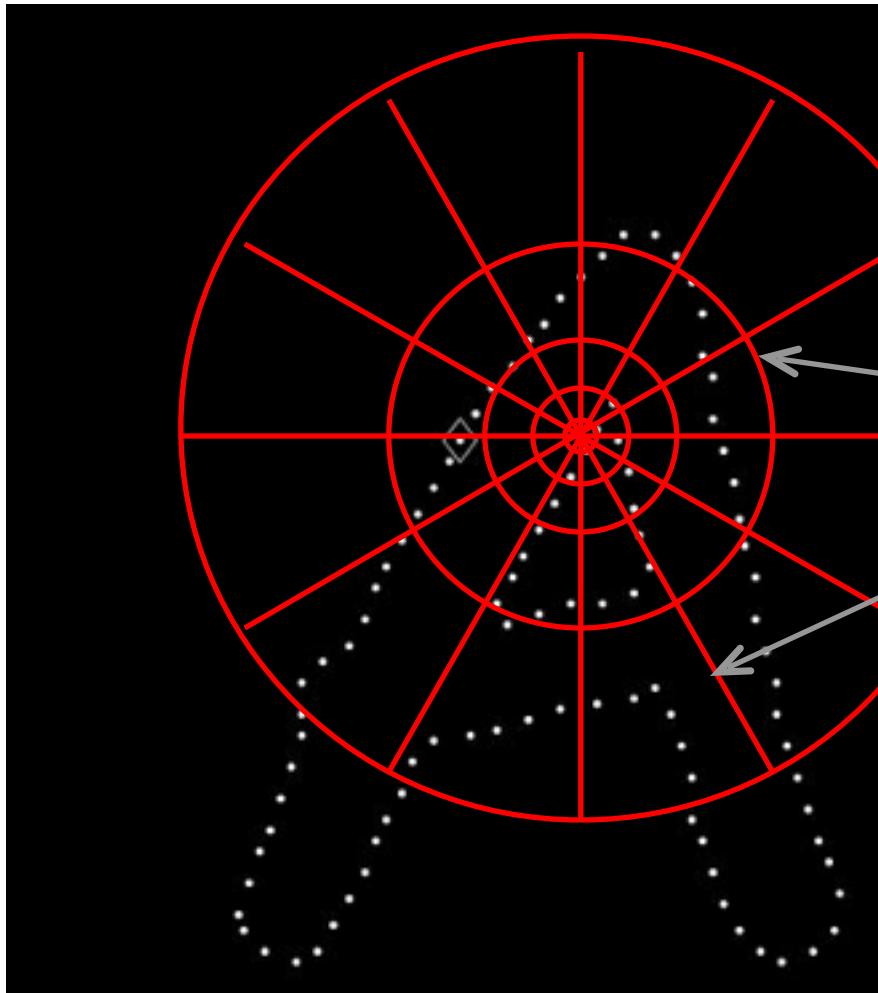

The distance threshold affects performance

- True positives = # of detected matches that are correct
  - Suppose we want to maximize these—how to choose threshold?
- False positives = # of detected matches that are incorrect
  - Suppose we want to minimize these—how to choose threshold?

# Local Descriptors: Shape Context

---

Count the number of points inside each bin, e.g.:

Count = 4

:

Count = 10

Log-polar binning: more precision for nearby points, more flexibility for farther points.
