$$h[m,n] = \sum_{k,l} g[k,l] f[m+k,n+l]$$

Box Filter

What does it do?

- Replaces each pixel with an average of its neighborhood
- Achieve smoothing effect (remove sharp features)

Gaussian vs. mean filters

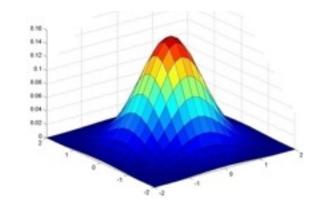

What does real blur look like?

Important filter: Gaussian

Spatially-weighted average

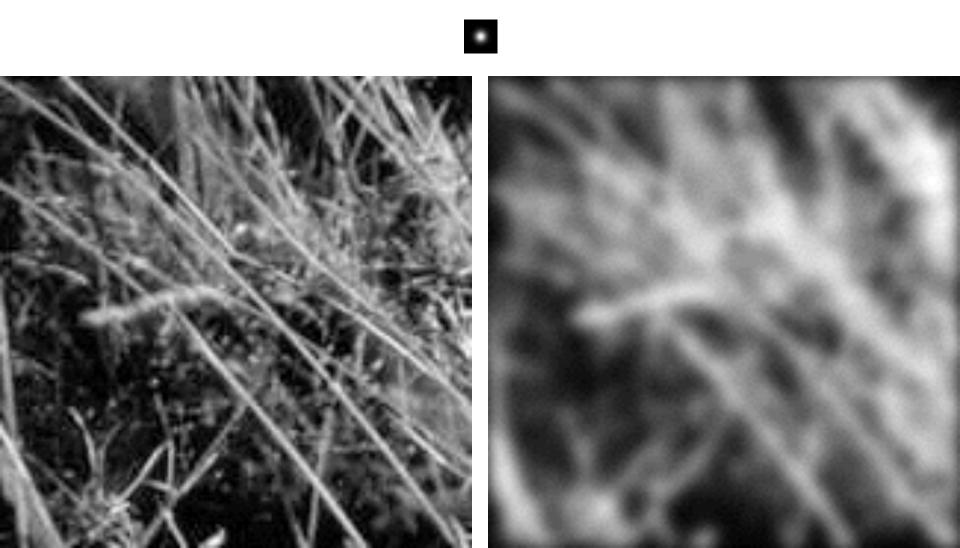

| 0.003 | 0.013 | 0.022 | 0.013 | 0.003 |
|-------|-------|-------|-------|-------|
| 0.013 | 0.059 | 0.097 | 0.059 | 0.013 |
| 0.022 | 0.097 | 0.159 | 0.097 | 0.022 |

| | 0.013 | | | |
| | | | | |

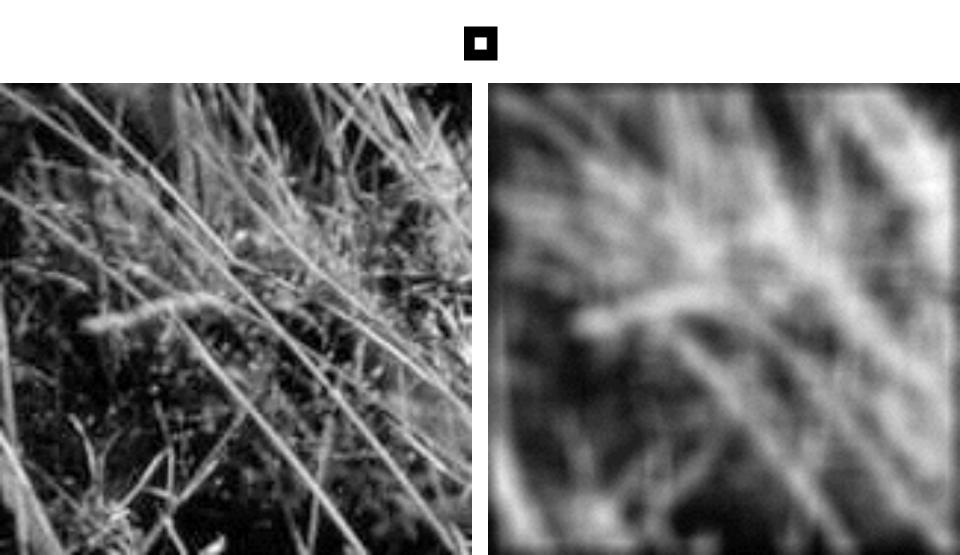

$$5 \times 5$$
, $\sigma = 1$

$$G_{\sigma} = \frac{1}{2\pi\sigma^2} e^{-\frac{(x^2+y^2)}{2\sigma^2}}$$

Smoothing with Gaussian filter

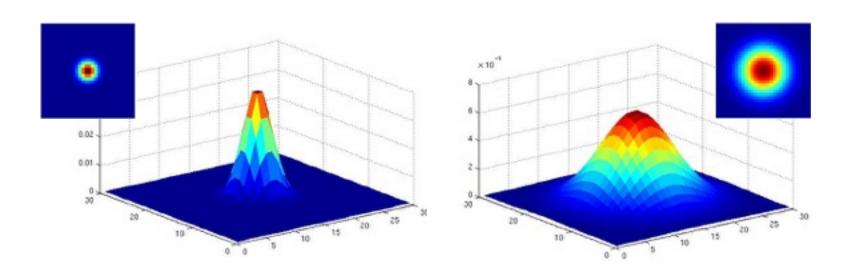

Smoothing with box filter

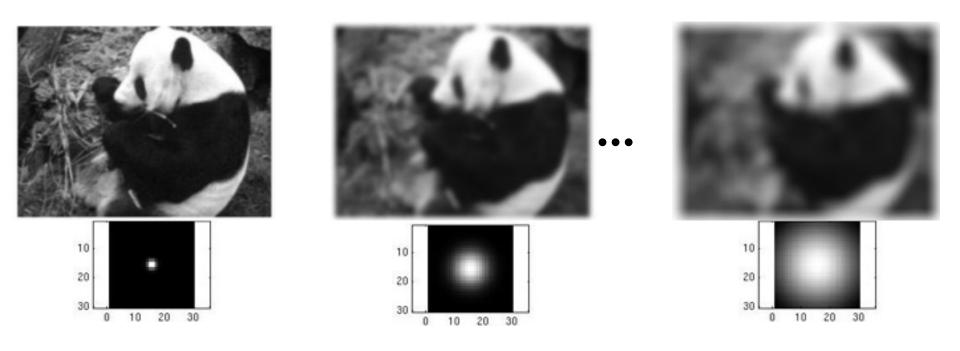

Gaussian filters

- What parameters matter here?
- Variance of Gaussian: determines extent of smoothing

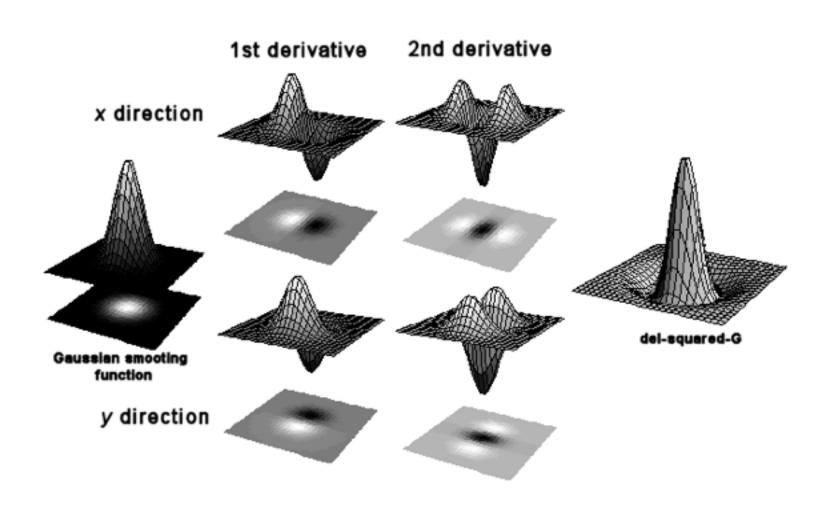

Smoothing with a Gaussian

Parameter σ is the "scale" / "width" / "spread" of the Gaussian kernel, and controls the amount of smoothing.

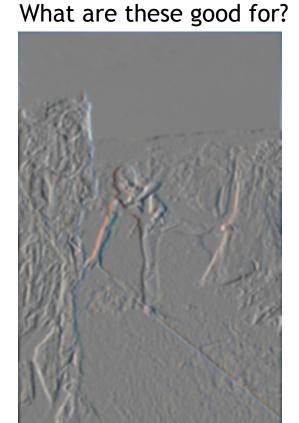

First and second derivatives

First and second derivatives

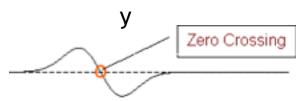

Original

First Derivative x

Second Derivative x,

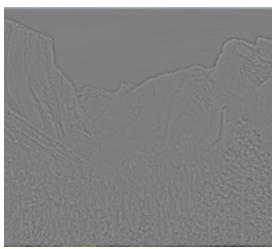

Subtracting filters

$$Sharpen(x,y) = f(x,y) - \alpha(f * \nabla^2 \mathcal{G}_{\sigma}(x,y))$$

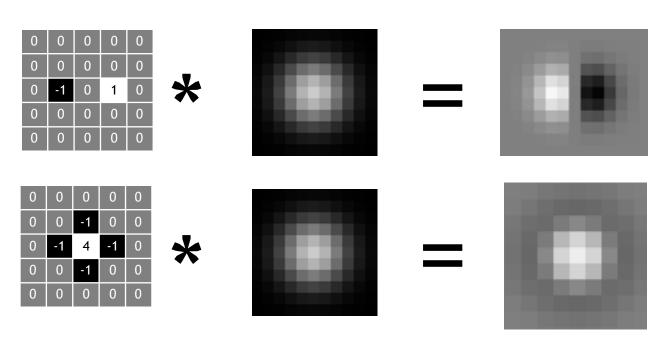

Second Derivative

Sharpened

Combining filters

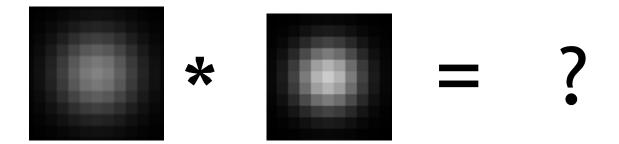

$$f * g * g' = f * h$$
 for some h

It's also true:
$$f*(g*h) = (f*g)*h$$

$$f*g = g*f$$

Combining Gaussian filters

$$f * \mathcal{G}_{\sigma} * \mathcal{G}_{\sigma'} = f * \mathcal{G}_{\sigma''}$$

$$\sigma'' = \sqrt{\sigma^2 + \sigma'^2}$$

More blur than either individually (but less $t\sigma'' = \sigma + \sigma'$)

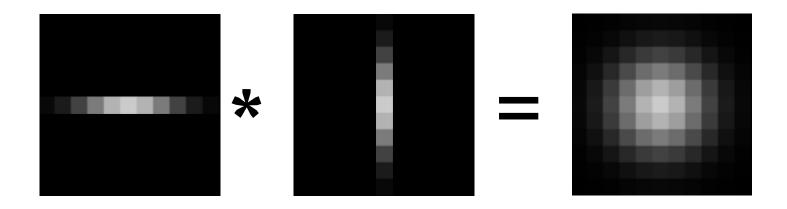

Separable filters

$$\mathcal{G}_{\sigma} = \mathcal{G}_{\sigma}^{x} * \mathcal{G}_{\sigma}^{y}$$

$$\mathcal{G}_{\sigma}^{x}(x,y) = \frac{1}{Z} e^{\frac{-(x^{2})}{2\sigma^{2}}}$$

$$\mathcal{G}_{\sigma}^{y}(x,y) = \frac{1}{Z} e^{\frac{-(y^{2})}{2\sigma^{2}}}$$

Compute Gaussian in horizontal direction, followed by the vertical direction faster!

Not all filters are separable. Freeman and Adelson, 1991

Sums of rectangular regions

How do we compute the sum of the pixels in the red box?

After some pre-computation, this can be done in constant time for any box.

This "trick" is commonly used for computing Haar wavelets (a fundemental building block of many object recognition approaches.)

| 17 | 26 | 12 | 160 | 255 | 255 | 109 | 22 | 26 | 19 | 35 | 24 |

Sums of rectangular regions

The trick is to compute an "integral image." Every pixel is the sum of its neighbors to the upper left.

Sequentially compute using:

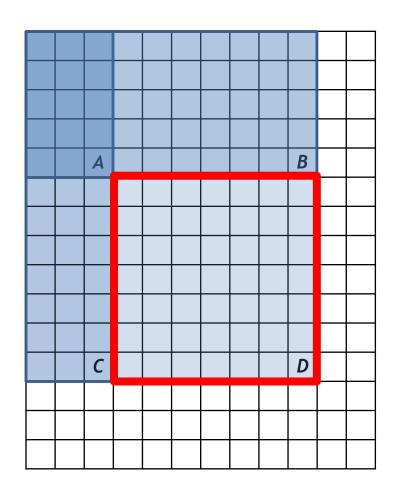

$$I(x,y) = I(x,y) + I(x-1,y) + I(x,y-1) - I(x-1,y-1)$$

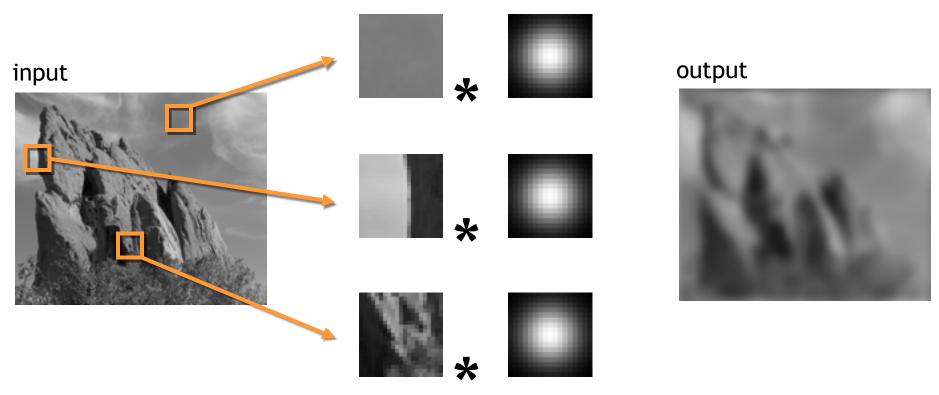

Sums of rectangular regions

Solution is found using:

$$A + D - B - C$$

Constant blur

Same Gaussian kernel everywhere.

Slides courtesy of Sylvian Paris

Bilateral Filter Definition: an Additional Edge Term

Same idea: weighted average of pixels.

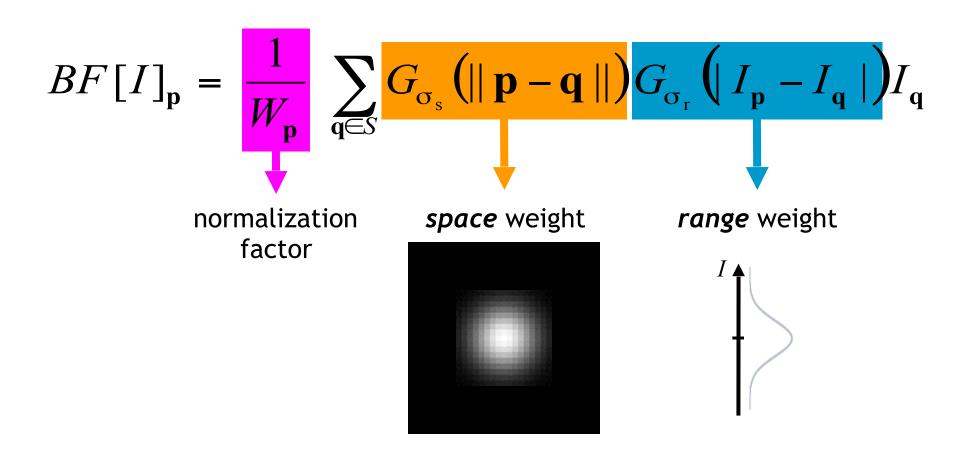

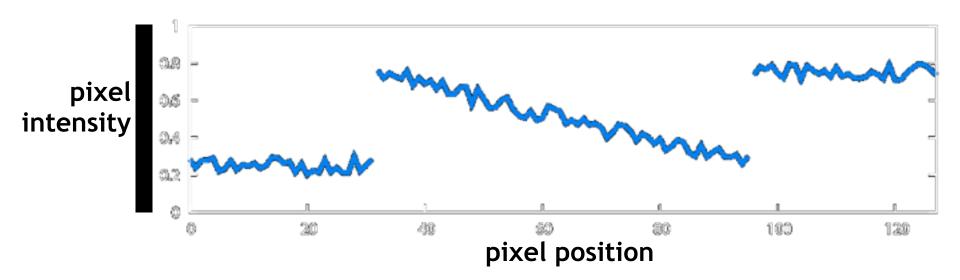

Illustration a 1D Image

1D image = line of pixels

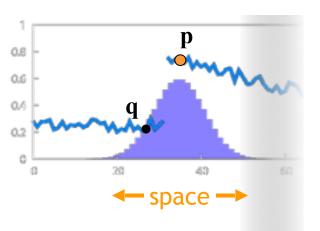

Better visualized as a plot

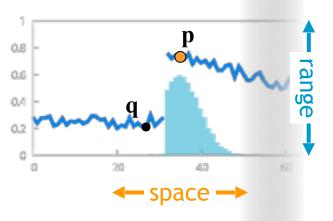

Gaussian Blur and Bilateral Filter

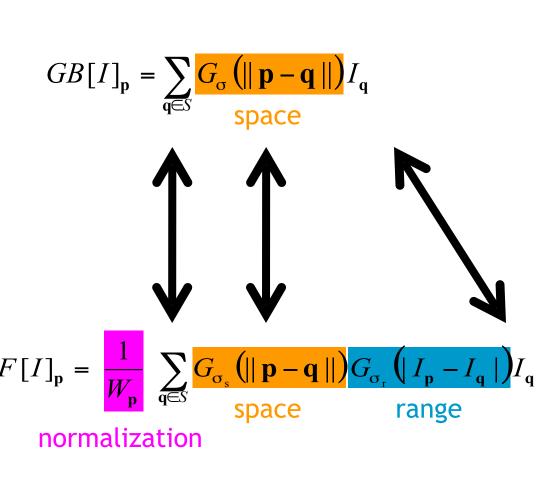

Gaussian blur

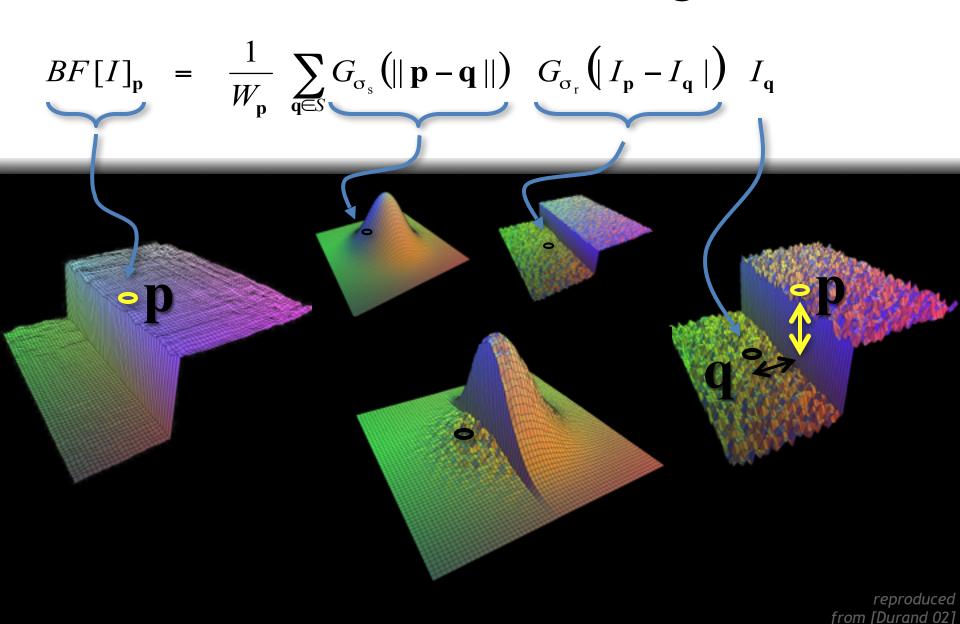

Bilateral filter

[Aurich 95, Smith 97, Tomasi 98]

Bilateral Filter on a Height Field

Space and Range Parameters

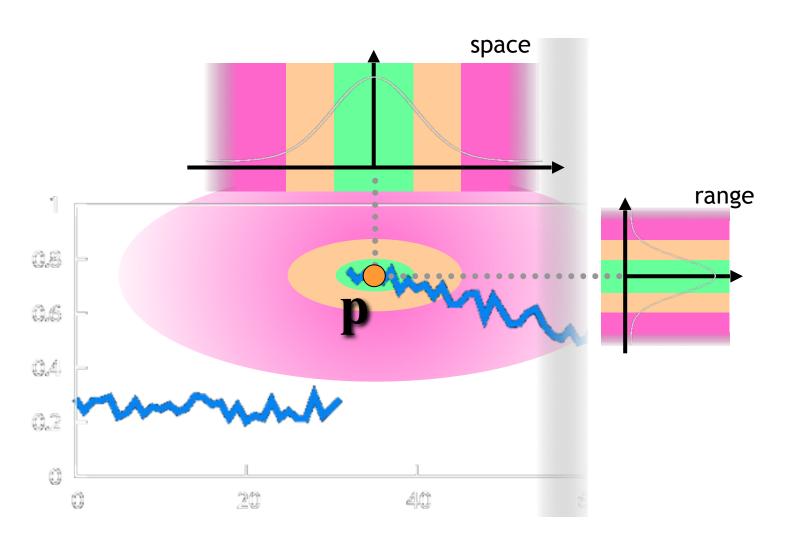

$$BF[I]_{\mathbf{p}} = \frac{1}{W_{\mathbf{p}}} \sum_{\mathbf{q} \in S} G_{\sigma_{s}} (||\mathbf{p} - \mathbf{q}||) G_{\sigma_{r}} (|I_{\mathbf{p}} - I_{\mathbf{q}}|) I_{\mathbf{q}}$$

• space σ_s : spatial extent of the kernel, size of the considered neighborhood.

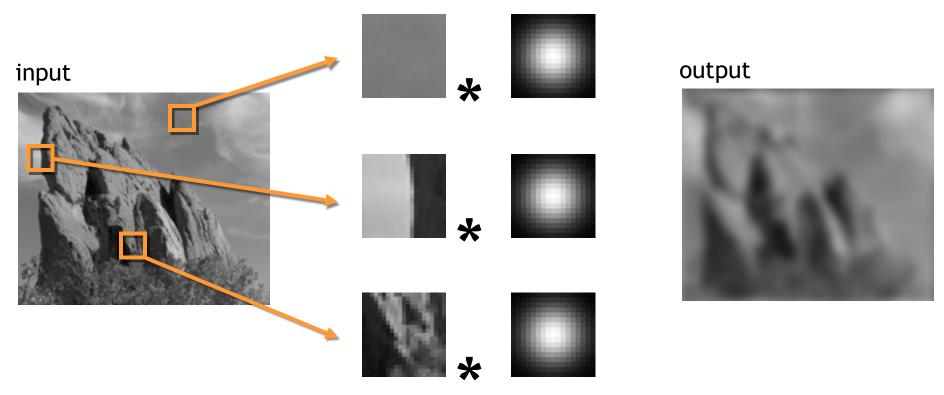

• range σ_r : "minimum" amplitude of an edge

Influence of Pixels

Only pixels close in space and in range are considered.

Constant blur

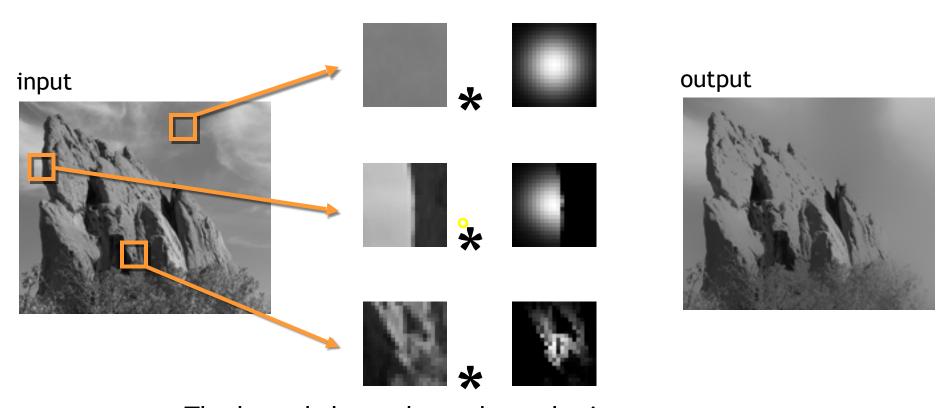

Same Gaussian kernel everywhere.

Slides courtesy of Sylvian Paris

Bilateral filter

Maintains edges when blurring!

The kernel shape depends on the image content.

Borders

What to do about image borders:
